TITLE: A wide-cut general purpose spray bar <sup>136</sup>

SOURCE: Zashchita rasteniy ot vreditel'ey i bolezney, no. 9, 1965, 30-31

TOPIC TAGS: spray bar, spray nozzle, agricultural machinery

ABSTRACT: This article describes a PAKh-30 collapsible, general purpose spray bar, used as an attachment to chemical plant protection machines. The L'vovsel'mash Factory is outfitting the GAN herbicide-ammonia machine with this bar. The PAKh-30 is intended for spraying field plants with chemicals against weeds, pests, and diseases. Separate sections of the bar may be used in cultivators, plows, and sowers as distributors of aqueous ammonia, or for spraying protective zones with herbicides. The technical characteristics of the bar are given in Table 1 of the Enclosure. The PAKh-30 may also be used in leaf-feeding of grains and other plants with mineral fertilizer. Orig. art. has: 2 figures and 1 table.

TITLE: Method of recording and reading information from a fine anisotropic ferromagnetic film. Class 21, No. 184936 [announced by Moscow Order of Lenin Aviation Institute imeni S. Ordzhonikidze (Moskovskiy ordena Lenina aviatsionny institut)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 16, 1966, 55

TOPIC TAGS: information storage, data recording, data readout, magnetic field

ABSTRACT: A method of recording and reading out of information from fine anisotropic ferromagnetic films is proposed. Recording is accomplished by a field acting along the mean easy axis of magnetization and reading by a field acting along the mean hard axis of magnetization. To store analog information, the value of the field which acts along the mean hard axis must exceed the value

Cord 1/2

UDC: 681.142.07

L 45833-66

ACC NR: AP6030574

of the anisotropy field. The recording field value which corresponds to the stored analog information lies within the region of boundary creep and shift, while the value of the reading field lies within the region of nondestructive readout.

AUTHOR: Shishkov, L. K.; Piskunkov, A. F.

TITLE: Some problem in the calculation of hydrogen-containing systems

SOURCE: Moscow. Inzh.-fiz. institut. Nekotoryye voprosy\* inzhenernoy fiziki (Some problems in engineering physics), no. 4, 1963, 14-33

TOPIC TAGS: hydrogen system, Boltzmann equation, hydrogen cross section, scatter, scattering angle, nuclear reactor, neutron age

ABSTRACT: Taking as their basic formula the Boltzmann equation in a diffusion approximation

$$\nabla \bar{\varphi}_1(u) + \Sigma \varphi_0(u) = \int_{-\infty}^u du' \Sigma_1(u') \varphi_0(u') f_0(u' \rightarrow u),$$

$$+ \int_{-\infty}^u du' \Sigma_{tr}(u' \rightarrow u) \varphi_0(u') \cdot \lambda(u) \int_{-\infty}^{\infty} \Sigma_1(u') \varphi_0(u') du',$$

$$\frac{1}{3} \nabla \bar{\varphi}_0(u) + \Sigma \bar{\varphi}_1(u) = \int_{-\infty}^u du' \Sigma_1(u') \bar{\varphi}_1(u') f_1(u' \rightarrow u),$$

Card 1/6

ACCESSION NR: AT4018974

where

$$\varphi_0(u), \varphi_1(u) = \varphi_0, \varphi_1(u, r)$$

and

$$\Sigma = \Sigma_n(u) + \Sigma_s(u) + \Sigma_{1n}(u)$$

with the boundary condition  $2\bar{\Phi} \cdot \bar{n} - \bar{\alpha}_0 = 0$  by  $S$ , the authors describe the transition to multi-group equations. The hydrogen cross sections are defined by the following formulas

$$\frac{\int_{u_k}^{u_{k+1}} du \int_{u_k}^{u'} du' [u' + u] \{ \Sigma(u') + \int_{u_k}^{u'} \Sigma(u'') du'' \}}{\int_{u_k}^{u_{k+1}} \frac{\Sigma(u') + \int_{u_k}^{u'} \Sigma(u'') du''}{\sigma_s(u')} du'}$$

ACCESSION NR: AT4018974

$$\sigma_H^{i-k} = \frac{\int_{u_k}^{u_{k+1}} du \int_{u_i}^{u_{i+1}} du' (u' + u) \chi(u') + \int_{u_i}^{u_{i+1}} \chi(u'') du''}{\int_{u_i}^{u_{i+1}} \chi(u') + \int_{u_i}^{u_{i+1}} \chi(u'') du''} du'$$

The problem of the non-hydrogen components is also considered and it is shown that for all elements, except hydrogen, the sections take on the form of the "transport approximation"

$$\sigma_u^{k-1-k} = \frac{(\xi)^k}{\Delta u_k} + \sigma_{in}^{k-1-k} \quad \sigma_u^k = \frac{(\xi)^k}{\Delta u_k} + \sigma_a^k + \sigma_{in}^k$$

$$\sigma_l^k = \sigma_s^k (1 - \mu) + \sigma_a^k + \sigma_{in}^k$$

where  $\xi$  is the mean-logarithmic energy loss at impact;  $\mu$  is the mean cosine of the scattering angle in the nuclei of the given element;  $\sigma_a$ ,  $\sigma_f$  are the cross sections in the resonance regions. The method of "moments" for the calculation of neutron age (plain geometry) is considered. The system of equations for the "moments" in plain geometry has the following form

Card 3/6

ACCESSION NR: AT4018974

$$\Sigma_0(u) M_0^0(u) - \int_{-\infty}^u du' M_0^0(u') \Sigma_1(u') f_1'(u' \rightarrow u) = X(u).$$

$$\Sigma_1(u) M_1^1(u) - \int_{-\infty}^u du' M_1^1(u') \Sigma_2(u') f_2'(u' \rightarrow u) = \frac{1}{3} M_0^0(u);$$

$$\Sigma_0(u) M_0^1(u) - \int_{-\infty}^u du' M_0^1(u') \Sigma_1(u') f_1'(u' \rightarrow u) = 2M_1^1(u).$$

with multi-group moment equations derived as follows

$$M_0^{(k)} \Sigma_0^k = \sum_{i=1}^{i=k-1} \Sigma_0^{i-k} M_0^{(i)} + X_k;$$

$$M_1^{(k)} \Sigma_1^k = \sum_{i=1}^{i=k-1} \Sigma_1^{i-k} M_1^{(i)} + \frac{1}{3} M_0^{(k)};$$

$$M_0^{(k)} \Sigma_0^k = \sum_{i=1}^{i=k-1} \Sigma_0^{i-k} M_0^{(i)} + 2M_1^{(k)};$$

Card 4/6

ACCESSION NR: AT4018974

In the computations two systems of constants were used, which correspond to the energy breakdowns adopted in a previous work (I. V. Gordeyev et al. Spravochnik po yadernno-fizicheskim konstantam dlya raschetov reaktorov. M., Atomizdat, 1960), making it possible to use the data given in that work with respect to the computation of the cross sections of fissionable and certain stable isotopes. The systems considered are a fifteen-group and a ten-group system. The solution of the problems in terms of criticality is considered on the basis of

$$\nabla^2 \bar{\varphi}_{1k} - \Sigma_0^k \varphi_{0k} - \sum_{l=1}^{k-1} \varphi_{0l} \Sigma_0^{k-l} - \frac{\lambda_k}{k \cdot v_0 \cdot \Phi} \sum_{l=1}^m \varphi_{0l} \Sigma_l^k v_l = 0.$$

$$\int_V \nabla \varphi_{0k} \cdot \Sigma_1^k \varphi_{1k} - \sum_{l=1}^{k-1} r_{1l} \Sigma_1^{k-l} = 0, \quad 2\varphi_{0k} n - \varphi_{0k} = 0 \text{ на } S,$$

and it is shown that practical interest attaches only to the zero harmonic of the stream:  $\varphi_0(r, u) = \int \varphi_0(r, u) \Omega \cdot d\Omega$ . These equations are so transformed as to exclude  $\varphi_1$ . In a separate section of the paper, the author discusses the determination of the magnitude of the extrapolated addition  $\delta$ , using a method proposed by V. V. Orlov. By way of example, in checking the accuracy of the methodology, neutron age is calculated in a water - iron mixture.

The authors express their deep gratitude to V. V. Orlov and S. B. Shikov for

TITLE: Mounting the ONK-B sprayer on a truck

SOURCE: Zashchita rasteniy ot vreditel'ey i bolezney, no. 5, 1965, 30-31

TOPIC TAGS: agriculture, agricultural equipment, aerosol

ABSTRACT: The author developed a method for mounting the ONK-B sprayer on a GAZ-51 truck, resulting in a self-propelled unit which is convenient for municipal parks and gardens. The mounting system, providing for control from the cab of the truck and convenient disassembly, is described in detail. The tank holds 800 liters and the pump, which is connected to the engine of the truck, performs 160 strokes/min, at 1,100 rpm, and a forward speed of 4.2 kph. In an addendum to the article, Mr. F. Aleksyuk comments that a similar mounting of the ONK-B sprayer on a GAZ-51 truck was accomplished in a simpler way in Krasnoyarsk, using a different system for transmitting power to the pump. AUTHOR: Bazilevskiy, M. V.; Piskun, N. I.

TITLE: Influence of substituents on the reaction of radical detachment of hydrogen from a methyl group

SOURCE: Zhurnal fizicheskoy khimii, v. 39, no. 3, 1965, 762-764

TOPIC TAGS: radical detachment, methyl group, hydrogen detachment, phenylazo-triphenylmethane

ABSTRACT: A study was made of the influence of electron-donor and electron-acceptor substituents in  $B(CH_3)_n$  molecules on the reactivity of hydrogen atoms of the methyl group in the reaction with the phenyl radical. The B substituents contained an active molecular group Y linked to a benzene ring or an aliphatic radical  $R = Ph(CH_3)_2C\cdot$ ;  $B = PhY\cdot$  or  $Ph(CH_3)_2CY\cdot$ ;  $Y = C, N, O, C=O, C=NOCOPh$ . The following reactions were considered:

Card 1/2

L 43023-65

ACCESSION NR: AP5008916

2

All the experiments were carried out at 60C with phenylazotriphenylmethane as the source of radicals. The methods by which the compounds were prepared and their characteristics are described. It was found that the presence of both electron-donor X groups and electron-acceptor C=X groups in the  $\alpha$  position relative to the methyl group increases the "stabilization energy"  $\Delta$  and thus facilitates the detachment of the hydrogen atom. This effect is more pronounced the lower the electronegativity of the heteroatom X. "The authors thank Prof. Kh. S. Bagdasar'yan for his interest in the work and its evaluation." Saris A Levin and A. Puzos. *Kosovos. (1941)*  
 Saris is a leather used in  
 the Orient as an interlining for shoe uppers. A sample from  
 China contained fat 22%, Al<sub>2</sub>O<sub>3</sub> 5.2% at 180°C, H<sub>2</sub>O 1.7% and  
 had a breaking strength of 1.8 kg/cm<sup>2</sup>. Saris prepared  
 from calf skin by the Moscow Leather Trust contained  
 fat 21%, Al<sub>2</sub>O<sub>3</sub> 4.8% and had a breaking strength of 2.3  
 kg/cm<sup>2</sup>. The hide was soaked, limed and pickled as  
 for chrome tanning. The final tanning was carried out in  
 a drum by dissolving 8% chromic acid in 50% H<sub>2</sub>O for 2  
 hrs, adding 8% alum and 20% H<sub>2</sub>O and continuing the  
 tanning for 3 hrs at 18-20°C. The product was dyed  
 in the spent tanning mill by adding tannin 1 g per l  
 vacuum solution at 1, drumming for 30 min, introducing  
 20% malachite green and drumming for another 30 min.  
 The leather was then dried and polished, moistened on  
 the grain side with a wet cloth, stacked and pressed at 1.5  
 atm at a temp not in excess of 50°C, placed in chambers  
 heated to 50°C and sprayed with a mixt. of paraffin wax  
 1 and spindle oil 2 parts. The above fat mixt.  
 at 40°C was heated to 80°C before spraying. The leather  
 was taken out of the chambers after 5 min, cooled and  
 polished. A. A. Boshtingk.

PERIODICAL *Ugol' Ukrainy*, 1955, No. 9, pp. 18-21

ABSTRACT Mine tests were made to study the effect of the grade of steel and heat treatment on the resistance to wear of the cutting teeth of coal mining machines made of UTA, 6K6S, EKS, OEKS, EKh, and E-350 steels. The best results were shown by 6K6S steel after oil quenching and tempering at 350-450°C to R<sub>40-45</sub>.

TITLE: Automatic recording of ionization curves

SOURCE: Pribory i tekhnika eksperimenta, no. 3, 1964, 123-125

TOPIC TAGS: spectrometer, mass spectrometer, MKh-1303 mass spectrometer,  
ionization curve recording

ABSTRACT: A device for automatic recording of ionization curves (up to one minute) in an MKh-1303 mass spectrometer is described. The ion-source electron gun generates 5-30-ev electrons for ionizing gases or vapors. The ionization and ion-extraction processes are time-separated. Resonance amplification of the ion current corresponding to the electron ionization with a specified energy scatter, synchronous detecting, and the direct recording of ionization

Cord 1/2

ACCESSION NR: AP4041032

curves provided a higher sensitivity and accuracy of the mass spectrometer in measuring ion-appearance potentials; also, the speed of taking ionization curves was increased compared to the known manual method of "quasi-monokinization" of electrons. Orig. art. has: 3 figures.

TITLE:

Paramagnetic Resonance in Potassium Ozonide (Paramagnitnyy rezonans v ozonide kaliya)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 37, Nr 1, pp 302 - 304 (USSR)

ABSTRACT:

Kazarnovskiy, Nikol'skiy and Abletsova (Ref 1) assumed that the magnetism of  $KO_3$  is caused by the  $O_3^-$ -ion and that the latter has the character of a free radical with unsaturated valence. The authors of the present "Letter to the Editor" investigated these conditions by employing the method of paramagnetic electron resonance. Polycrystalline samples containing  $\sim 90\%$   $KO_3$  were investigated at the frequencies of 2580, 9375, 12,000 and 37,000 megacycles, at room temperature, as well as at the temperature of liquid nitrogen. In the case of the first 3 experimental frequencies, an absorption line of symmetrical shape was in each case obtained, which had half-widths of  $31 \pm 3$ ,  $39 \pm 2$ , and  $45 \pm 3$  G respectively; at 37,000 megacycles, however, an asymmetric line (see figure) with a width of  $\sim 77$  G (at room temperature) was

Card 1/3

## Paramagnetic Resonance in Potassium Ozonide

SCV/56-37-1-43/64

found. The asymmetry indicates an anisotropy of the  $g$ -factor. For parallel and perpendicular orientation respectively of the crystal with respect to the direction of the external magnetic field,  $g_{\parallel} = 2.005 \pm 0.003$  and  $g_{\perp} = 2.012 \pm 0.002$  was found respectively. In the following, the contributions made by spin-lattice-, magnetic dipole-, and spin-spin exchange interaction is discussed. By means of the same method other authors (Ref 4) investigated also  $\text{NaO}_3$ ; at  $\lambda = 1.25$  cm they found a weak asymmetry of the line, and the value of the  $g$ -factor determined by them agrees within the error limits with that found here for  $\text{KO}_3$ , which confirms the assumption that in ozonides the binding of the metal with the  $\text{O}_3$  group has ion character. The authors also investigated the spontaneous decay of  $\text{KO}_3$  at a temperature of  $295^\circ\text{K}$  by means of diphenylpicrylhydrazyl as a standard. It was found that the  $\text{KO}_3$ -decay developed approximately according to an exponential law (time constant  $0.02/\text{hour}$ ). The authors finally thank D. N. Shigorin and S. D. Kaytmazov for their help in carrying out the experiments and for discussing the results. There

TITLE:

The Electron Paramagnetic Resonance <sup>1</sup> Spectra of Some Chelate  
Compounds of Copper

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol 130, Nr 6, pp 1264 - 1287  
(USSR)

ABSTRACT:

The authors investigated the e.p.r. spectra of the chelate compounds of copper with various azo-compounds as well as with the enol-form of acetylacetone and acetoacetic ester. Measurement of the magnetic moments showed that copper forms the compound with two valence electrons. If the initial state of the Cu-atom is  $d^{9sp}$ , it must have an unpaired electron. As, e.g., copper forms four equivalent bonds with acetylacetonate, it is presumed to enter into direct interaction with the  $\pi$ -electrons of the entire system. An investigation was carried out with the purpose of finding out whether the unpaired electron of the metal remains localized on the Cu-atom or whether it is delocalized in the molecule. Table 1 gives the experimental data of the compounds investigated; The width  $\Delta H$  of the line

Card 1/3

57-98

for 9370 mc, the g-factors, and the magnetic moments. In the acetylacetonate of Cu  $\Delta H$  decreases considerably when substituents (O=C-CR or Cl) are introduced. In the azo-compounds of copper, which are still richer in  $\pi$ -electrons,  $\Delta H$  becomes still more contracted. Substitution by chlorine also causes contraction. The increase in  $\pi$ -electrons is found to lead to a contraction of the absorption line. Here, chlorine in ortho position exerts the strongest influence. The authors arrive at the conclusion that the unpaired electron enters into interaction with the  $\pi$ -electrons of the azo group, and by way of this group indirectly with the  $\pi$ -electrons of the entire system. This interaction was confirmed by analysis of the e.p.r. spectra of the compounds dissolved in benzene, chloroform, or dioxane (Fig 1). Their intensity depends on the nature and structure of the complex group. There are 1 figure, 1 table, and 5 references, 2 of which are Soviet

TITLE: The Influence of Signal Generator Frequency  
Fluctuations on the Sensitivity of Radio Telescopes  
With Transit and Reflex Resonators

PERIODICAL: Radiotekhnika i elektronika, 1961, Vol.6 No. 3,  
pp 437-443

TEXT: This article compares the signal-noise ratios at the input to a receiver in the cases of transit and reflex resonators. The signal is taken as the variation in amplitude of the traveling or reflected wave caused by paramagnetic absorption. The work constitutes an extension of earlier published work (Ref.1) and the authors' own previous work (Ref.2). A general analysis shows that the magnitude of the signal in the reflex circuit is greater than that in the transit circuit by a factor of 4. In neither circuit is matching critical. Variation of the reflection factor between 0 and 0.1 leads to a signal reduction of not more than 1%. Under optimal matching conditions and identical amplitudes of the incident wave the high-frequency magnetic field intensity

Card 1/3

21660

S/109/61/006/003/015/018

E140/E135

The Influence of Signal Generator Frequency Fluctuations on the Sensitivity of Radio Telescopes With Transit and Reflex Resonators in the transit resonator is  $\sqrt{2}$  times as small as in the reflex resonator and therefore the intensity of paramagnetic absorption in the transit resonator is half. Passing to the question of the effects of frequency instability under the assumption of constant amplitude the authors distinguish between fluctuations due to causes of principle and those due to technical reasons (Ref.3). Technical causes can be power supply instability, flicker effect, microphonic effects. Considering only the case where the mean frequency of the generator is equal to or very close to the natural frequency of the resonator, while the frequency fluctuation dispersion does not exceed 50 kcs, while the spectrum of frequency instability extends from 0 to 20 kcs, the authors apply the method of instantaneous frequency. The results are applicable to spectrosopes with magnetic field modulation in the audio range. The preliminary analysis shows that the root-mean-square deviation of amplitude fluctuations for the travelling wave are proportional to the incident wave amplitude. At exact tuning the root-mean-  
Card 2/3

S/109/61/006/003/015/018

E140/E135

The Influence of Signal Generator Frequency Fluctuations on the Sensitivity of Radio Telescopes With Transit and Reflex Resonators

square deviation is proportional to the square of the ratio of root-mean-square frequency deviation to the half-width of the resonator curve. With detuning, the root-mean-square amplitude fluctuations of the travelling wave are proportional to the ratio of mean-square frequency deviation to the half-width of the resonant curve. Similar relations are obtained for the reflex resonator except that the coefficient of reflection enters into the expressions. To increase the sensitivity of radiospectroscopes it is necessary to decrease the magnitude of frequency noise. This requires the highest possible stability of the signal generator (reduction of the frequency fluctuation dispersion) and an appropriate choice of tuning and matching elements in the waveguide channels. The frequency noises in the transit circuit are approximately two orders of magnitude less than those in the reflex circuit which is particularly important. ✓
